## CERTIFICATE

This is to certify that the Capstone Project work titled **DESIGN AND ANALYSIS OF LENGTHWISE GRADIENT HONEYCOMB CORE FOR OBTAINING GRADED BEAM PROPERTIES**" that is being submitted by **PERI SHANMUKHA RAM (17BME7047)** is in partial fulfilment of the requirements for the award of Bachelor of Technology, is a record of bonafide work done under my guidance. The contents of this Project work, in full or in parts, have neither been taken from any other source nor have been submitted to any other Institute or University for award of any degree or diploma and the same is certified.

Dr.P.S.Ramasreekanth

Guide

The thesis is **satisfactory / unsatisfactory**

**Internal Examiner**

**External Examiner**

## **ACKNOWLEDGEMENTS**

I would like to express my sincere gratitude to several individuals and organizations for supporting me throughout my four years of Under graduation. First, I wish to express my sincere gratitude to my project guide, Professor P S Rama Sreekanth, for his enthusiasm, patience, insightful comments, helpful information, practical advice and unceasing ideas that have helped me tremendously at all times in my research and writing of this thesis. His immense knowledge, profound experience and professional expertise in Honeycomb technology has enabled me to complete this research successfully. Without his support and guidance, this project would not have been possible. I could not have imagined having a better supervisor in my study.

Besides my guide, I would like to thank the rest of my thesis committee: Prof. Manikanta Ravindra Kumar Vakkalagadda, Prof. Pankaj Tambe and, Prof.Amit kumar for their encouragement, insightful comments and hard questions.

## **ABSTRACT**

In this paper different types of honeycomb structures are designed and are different properties are compared like total deformation of structure when fixed at one end and a point load is acted on free end. Also, a gradient Honeycomb structure is designed to check whether the gradient cell honeycomb structure (along length) offers more bending resistance or not. This Gradient honeycomb structure is compared within different cell-oriented structures and also compared with different regular honeycomb structure to prove that gradient honeycomb structure deforms less comparatively to regular honeycomb structure. Modal Analysis is also performed on both vertical and horizontal cell oriented gradient honeycomb structures to study the dynamic characteristics of a structure under vibrational excitation. Natural frequencies, mode shapes and mode vectors of a structure were found out using modal analysis. Gradient honeycomb structures are tested for impact loading on the free end of structure at three different speeds i.e., 40kmph, 20kmph and 10kmph to extract energy absorption graphs.

# CHAPTER 1

## INTRODUCTION

Honeycomb Structures are natural or man-made structures that have the geometry of a honeycomb which allows the utilization of material to be minimum. There are different types of geometry for honeycomb structures but the common feature of all such structures is an array of hollow cells formed between thin vertical walls. The most common type is hexagonal cell shape honeycomb. However, to meet different engineering applications triangular cells, square cells, and circular-cored hexagonal cells, and circular-cored square cells are also used.

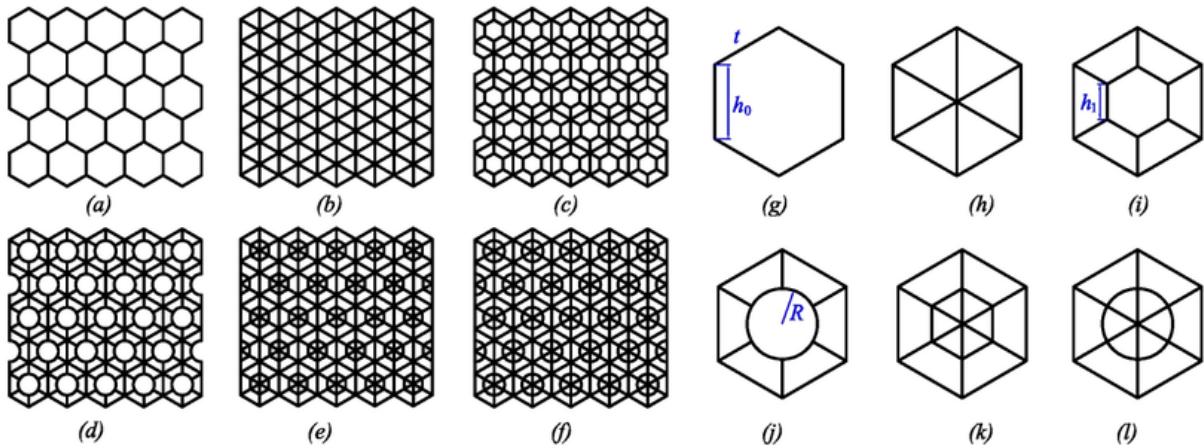

Figure 1 Honeycomb Structures with kinds of inside cells.

- a. General Structure
- b. Triangular
- c. Double hexagonal
- d. Inside circular
- e. Full double hexagonal
- f. Full insider circular

A honeycomb shaped structure provides a material with minimal density and relatively high out-of-plane compression properties and out-of-plane shear properties. Honeycomb structural material between two thin layers that provide strength in tension. This forms a plate-like assembly. Honeycomb materials are widely used where flat or slightly curved surfaces are in need and they have high specific strength. They are widely used in the aerospace industry for this reason,

and honeycomb materials in aluminum, fiberglass and advanced composite materials have been featured in aircraft and rockets since 1950's.

Man-made honeycomb structures include sandwich-structured composites with honeycomb cores. Man-made honeycomb structures are manufactured by using a variety of different materials, depending on the intended application and required characteristics, from paper or thermoplastics, used for low strength and stiffness for low load applications, to high strength and stiffness for high performance applications, from aluminum or fiber reinforced plastics. There are five basic ways of making honeycomb: adhesive bonding, resistance welding, brazing, diffusion bonding and thermal fusion. These methods are based on how the nodes are attached. By far the most common manufacturing method is adhesive bonding; perhaps as much as 95% of the honeycomb cores are made this way. Resistance welding, brazing or diffusion bonding are only used on cores that must see high temperatures or severe environmental conditions as it is much more expensive to manufacture core by these processes.

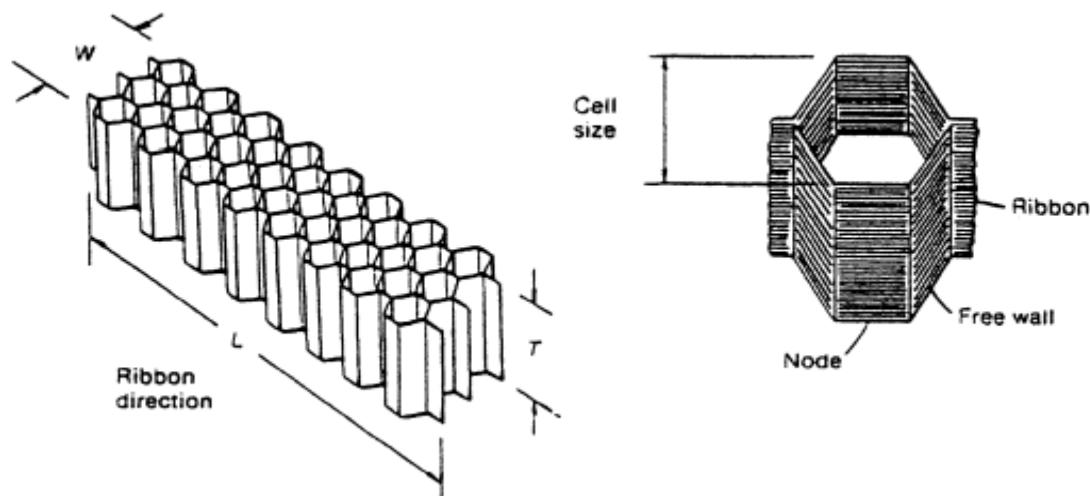

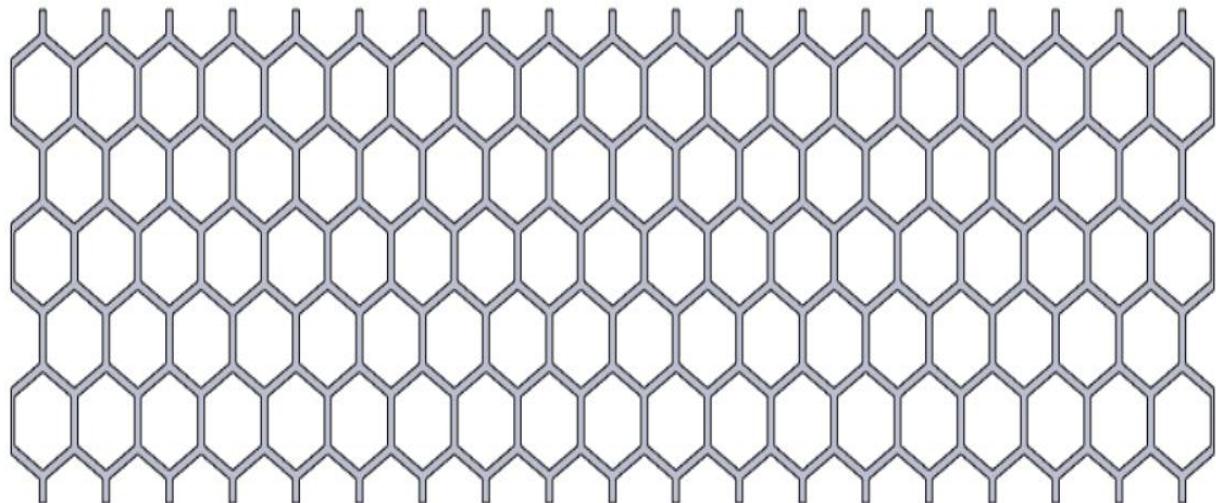

Figure 2 Honeycomb terminology

- Honeycomb density - the weight of one cubic foot of core, expressed in pounds per cubic foot (pcf) or the weight of one cubic meter of core, expressed in kilograms per cubic meter ( $\text{kg/m}^3$ ).
- Cell - a single honeycomb unit, usually a hexagon.
- Ribbon - the flat sheet material constituting the honeycomb, also referred to as web.

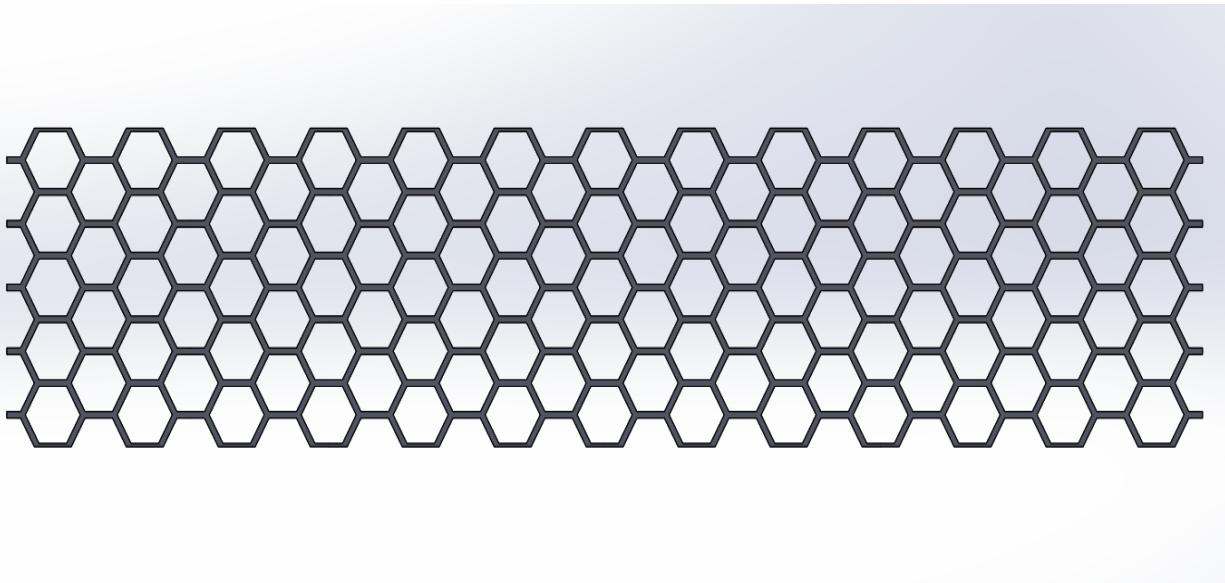

- Node - the bonded portion of adjacent ribbon sheets, double sheets.
- Free wall - cell wall sections of single unbonded sheets.
- L direction - the core ribbon direction, the direction of continuous sheets.
- R direction - the core ribbon direction, same as the L direction.
- W direction - the direction in which the core is expanded or perpendicular to the ribbon direction.
- T direction - the core direction parallel with the cell openings.
- HOBE - Honeycomb Before Expansion, the solid block of bonded sheets.
- CUE - Core Unexpanded, the solid block of bonded sheets.

### **Project Terminology:**

**Figure 3 Honeycomb Structure (Vertical cell-orientation)**

- Vertical cell-oriented Honeycomb Structure

**Figure 4 Honeycomb Structure (Horizontal cell-orientation)**

- Horizontal cell-oriented Honeycomb Structure
- The basic honeycomb element consists of one edge and two free walls. The various parameters that are derived from geometry of honeycomb given in the following table and are derived as follows:

- Honeycomb density ( $HD$ ) = 
$$\frac{2(q + p) t \rho_s}{(q + p \cos \theta) (2p \sin \theta)}$$
- Cells per honeycomb surface area ( $C/HSA$ ) = 
$$\frac{1}{(q + p \cos \theta) (2p \sin \theta)}$$
- Exposed foil area per honeycomb volume ( $EF\ A/HV$ ) = 
$$\frac{2(q + 2p)}{(q + p \cos \theta) (2p \sin \theta)}$$
- Foil edge area per honeycomb surface area ( $FEA/HSA$ ) = 
$$\frac{2(q + p) t}{(q + p \cos \theta) (2p \sin \theta)}$$

- where,  $p$ =free wall length,  $q$ =node width,  $\theta$  =expansion angle,  $t$ = web thickness,  $\rho_s$  = web density.
- Web density of PCTPE nylon filament is  $0.0011\text{gm/mm}^3$  or  $1.1\text{kg/m}^3$ .
- As cell's longest diagonal length decreases along rows i.e., each column will have same cell size, the properties such as Honeycomb density, Cells per honeycomb surface area, foil edge area per honeycomb surface area, exposed foil area per honeycomb volume decrease.

Cell longest diagonal (mm)	Free wall length (a)mm	Node width (b)mm	Expansion angle (degrees)	Web thickness (t)mm	Web density Gm/mm <sup>3</sup>	Honeycomb density (HD)kg/m <sup>3</sup>	C/HAS Cells per honeycomb surface area Cells/mm <sup>2</sup>	FEA/HSA Foil edge area per honeycomb surface area Mm <sup>2</sup> /mm <sup>2</sup>	EFA/HV Exposed foil area per honeycomb volume Mm <sup>2</sup> /mm <sup>3</sup>

### 1.3 Organization of the Report

The remaining chapters of the project report are described as follows:

- Chapter 2 contains the background and literature survey and objectives of project
- Chapter 3. proposed system, and hardware and software details, Design of regular Honeycomb structure, boundary conditions, methodology, deformation of regular honeycomb structures, deformation of different cells in regular honeycomb structure.
- Chapter 4 gives designs, boundary conditions, methodology, and design of gradient honeycomb structure, deformation, modal analysis, and impact analysis.
- Chapter 5 discusses the results and inferences obtained after the project was implemented.

- Chapter 6 concludes the project and discusses about future work.
- Chapter 7 gives references.

## **Chapter 2**

### **Background and Literature Survey**

The book titled “Tom Bitzer auth. Honeycomb Technology Materials, Design, Manufacturing, Applications and Testing.” Through this book, we get fundamentals of honeycomb structure, terminology, different web materials, honeycomb types, cell configurations, materials used, manufacturing processes, applications, evolution of applications of honeycomb structures in different fields of study. Particularly I had referred the manufacturing methods of honeycomb structures section. There are five processes, namely, Adhesive bonding, resistance welding, brazing, diffusion bonding and thermal fusion. Depending on web material, manufacturing process is selected. For instance, brazing and resistance welding is only used on cores that see high temperatures or severe environmental conditions. This book also insights about all strength and compares honeycomb structures with different plane panels to prove its maximum strength.

The first paper I referred was “Design and Analysis of Honey Comb Structures with Different Cases.” Authored by Shaik.Nazeer and Shaik Allabakshu from department of aerospace engineering, Nirma Institute of Science and Technology. It discussed a case, in which a honeycomb structure was designed of length 0.085m, width of 0.115m and thickness of 0.0007m. One side of Honeycomb structure was fixed and pressure was applied on face panel of structure. Total deformation, stress and strain was found out using Ansys workbench with different material assigned. This paper gave more insights on design methodology, material selection and also explained different phases of design of honeycomb structure.

So, from the above paper and book the understanding is that Honeycomb structures have a wide range of applications. Secondly, the use of honeycomb structures can reduce the weight by certain amount by offering more strength. All the papers, I referred had regular honeycomb structures used for experiments and analyzing results. If we decrease cell size gradually in length direction, the cell wall thickness along length direction also increases resulting in more resistance

than the previous cell as the cell wall thickness of right most cell has more thickness than the left cells to it.

The third paper was authored by Santosh kumar sahu, Nitesh Dhar Badgayan from department of Mechanical Engineering, Amrita School of Engineering and North Eastern Regional Institute of Science and Technology respectively. This paper is titled “Influence of cell size on out of plane stiffness and in-plane compliance character of the sandwich beam made with tunable PCTPE nylon honeycomb core and hybrid polymer nanocomposite skin.” This paper talks about fabrication of hybrid sandwich beams made with PCTPE nylon. Some part of this paper deals with honeycomb core geometry and fabrication section to understand parameters derived from geometry such as Honeycomb density, cells per honeycomb surface area, exposed foil area per honeycomb volume, foil edge area per honeycomb surface area. As I started working on to decrease cell size along length, I had to work on these properties for different dimensions to observe the trend for gradient honeycomb structure.

The fourth paper, “Modal Analysis and Harmonic Response Analysis of a Crankshaft” authored by Dr.C.M Ramesha, Abhijith KG, Department of Mechanical Engineering, M.S.R.I.R Bangalore, India. I used this paper as reference for modal analysis of honeycomb structure. Although this paper was not related to honeycomb structure but, modal analysis part of this paper was used to understand and study the dynamic characteristics of gradient honeycomb structure under vibrational excitation.

## **1.1 Objectives**

The following are the objectives of this project:

- To design Honeycomb Structure of varying diagonal length cell size by keeping cell size constant along length direction.
- To evaluate and compare deformation of regular honeycomb structure and varying cell honeycomb structure.
- To evaluate and compare deformation of different honeycomb structures with different cell orientation (Regular and varying structures).
- To evaluate and compare deformation and energy absorption of varying cell honeycomb structures (Sleeping and standing cell-oriented structures) at different cases.

- To perform modal analysis to determine the vibrational characteristics of honeycomb structure

## CHAPTER 3

# DESIGN AND ANALYSIS OF LENGTHWISE GRADIENT HONEYCOMB CORE FOR OBTAINING GRADED BEAM PROPERTIES

This Chapter describes the proposed system working methodology, software and hardware details.

## 2.1 Proposed System

The following block diagram (figure 2) shows the system architecture of this project.

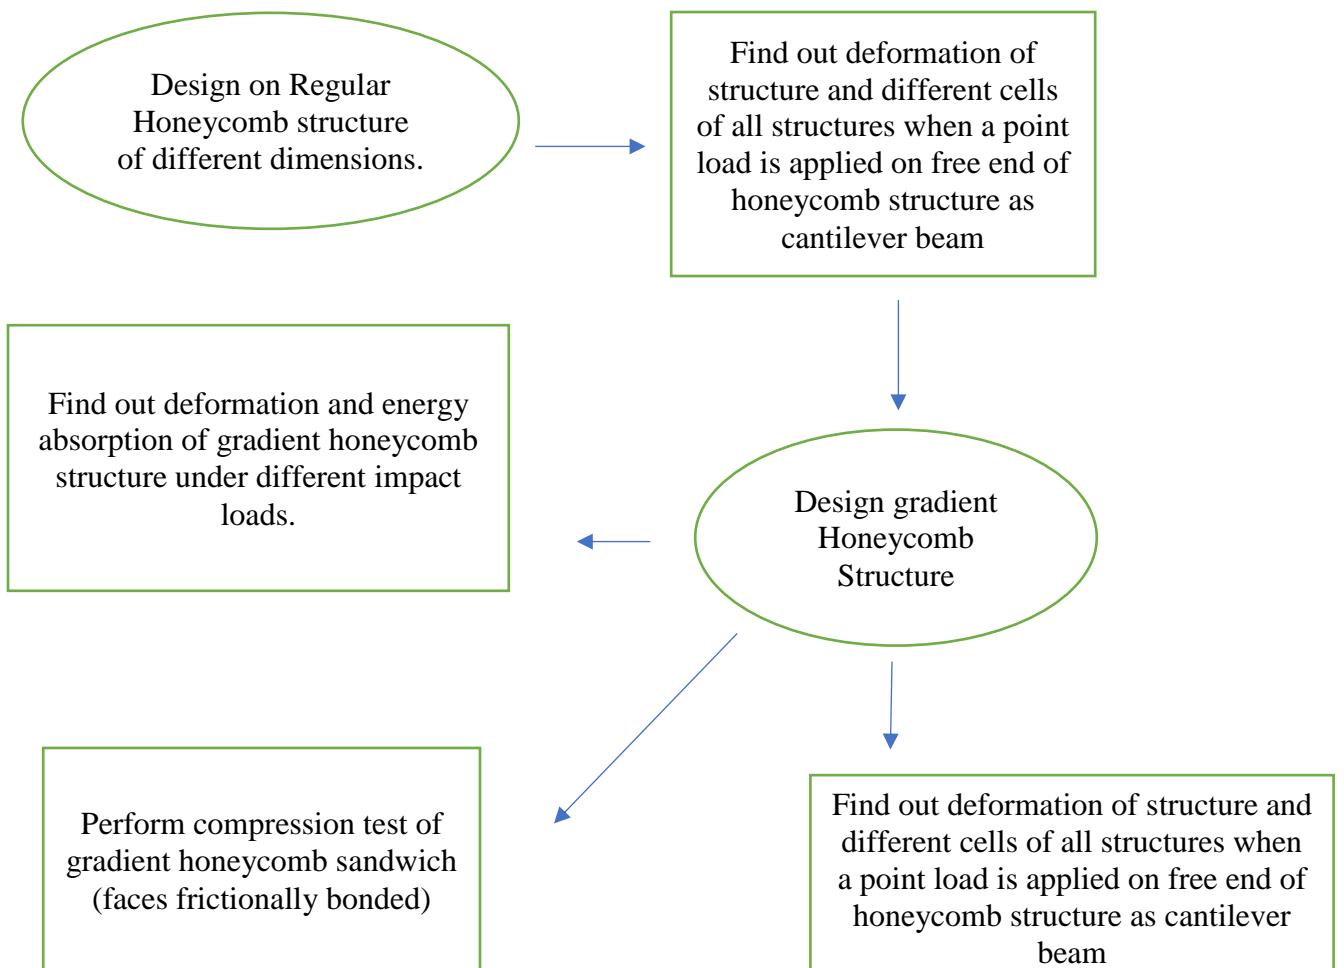

Figure 5 System Block Diagram

## 2.2 Working Methodology

Whole project was implemented in software by simulations. Firstly, Honeycomb Structures of different cell sizes and cell wall thickness are designed and are simulated to find out deformation of total structure and deformation of different cells in honeycomb when one side of structure is fixed. Secondly, after observing and inferring the relation between dimensions and deformation, gradient honeycomb structure along ribbon direction is designed. Again, the gradient structures are simulated to find out deformation of structure and then compare with regular honeycomb.

To conduct impact loading simulation, a sphere is designed on top plane of honeycomb structure. Before simulating, the sphere is given certain velocity and made it to impact honeycomb structure. This process is repeated for at different velocities and energy graphs are extracted.

### Design of Honeycomb Structure (Vertical cell orientation and horizontal cell orientation)

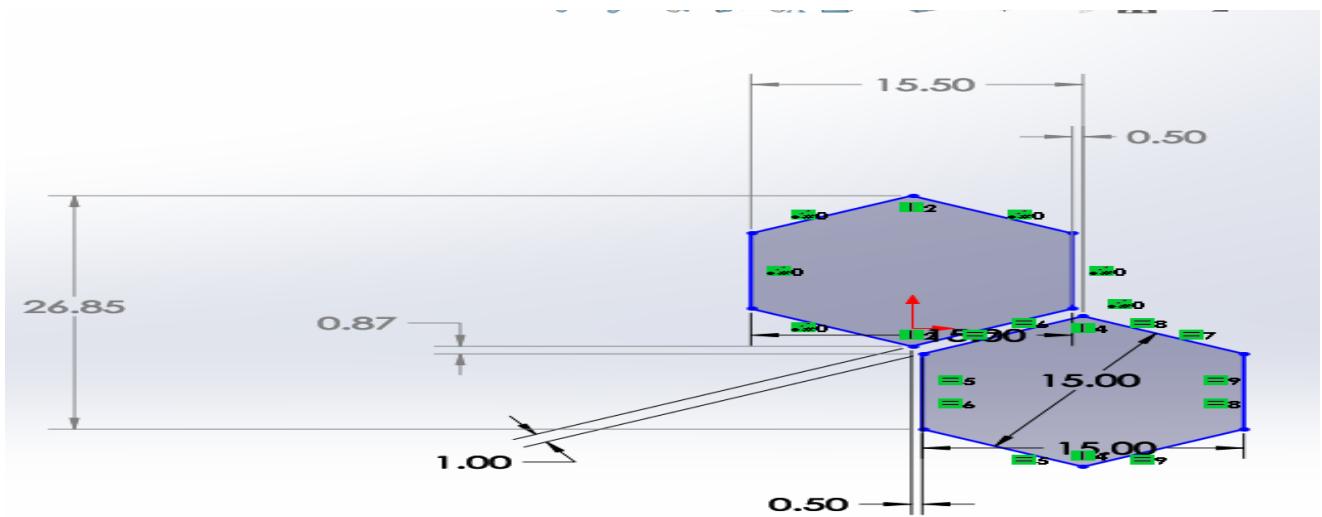

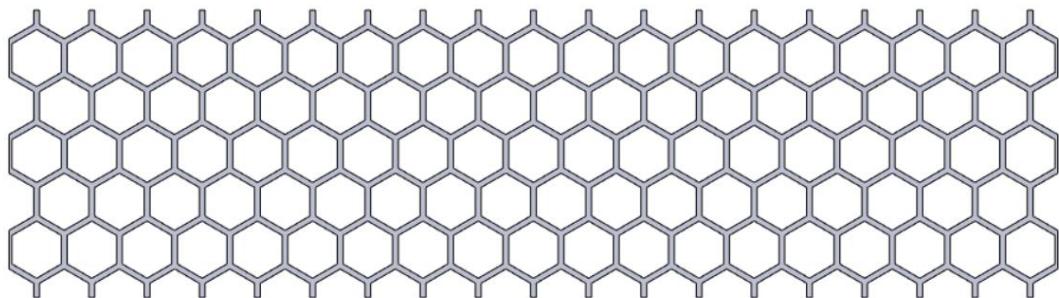

Figure 6 Cell dimensions of Regular Honeycomb Structure

- In total, twelve regular honeycomb structures were designed with different dimensional combinations. All the structure core has approximated length of 220mm, width of 50mm and thickness of 30mm.
- All the twelve different honeycomb structures dimensions are listed in below table.

Cell orientation	Cell diagonal size (mm)	Cell wall thickness (mm)
Vertical	21	1.2
Vertical	15	1.2
Vertical	12	1.2
Vertical	21	1
Vertical	15	1
Vertical	12	1
Horizontal	21	1.2
Horizontal	15	1.2
Horizontal	12	1.2
Horizontal	21	1
Horizontal	15	1
Horizontal	12	1

## Boundary Conditions:

**Figure 19 Honeycomb Structure (Vertical cell-orientation), fixed at one end (Cantilever beam).**

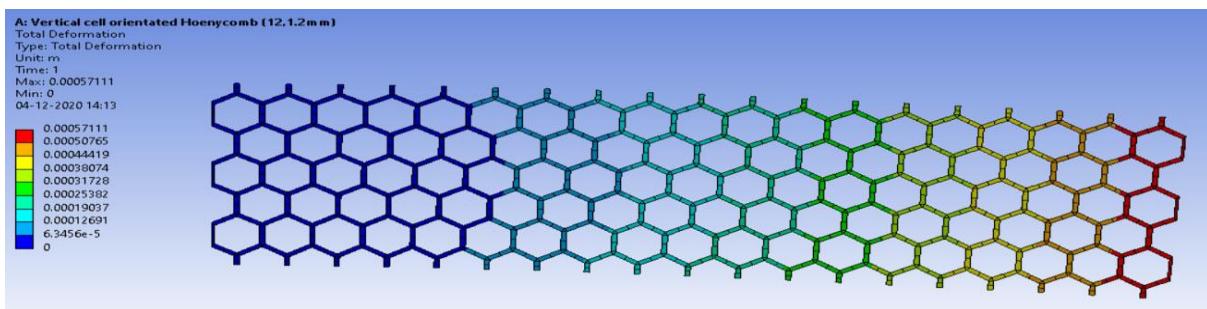

**Figure 20 Honeycomb Structure (Vertical cell-orientation), Applying point load (100N) at free end.**

- Honeycomb Structure is fixed at one end and 100N force is applied on the other end of structure.
- Total deformation of structure and cell deformation of different cells in different columns were found out in ANSYS.
- Element type- Linear tetrahedral
- All the simulations are performed at ambient temperature (22 °C)

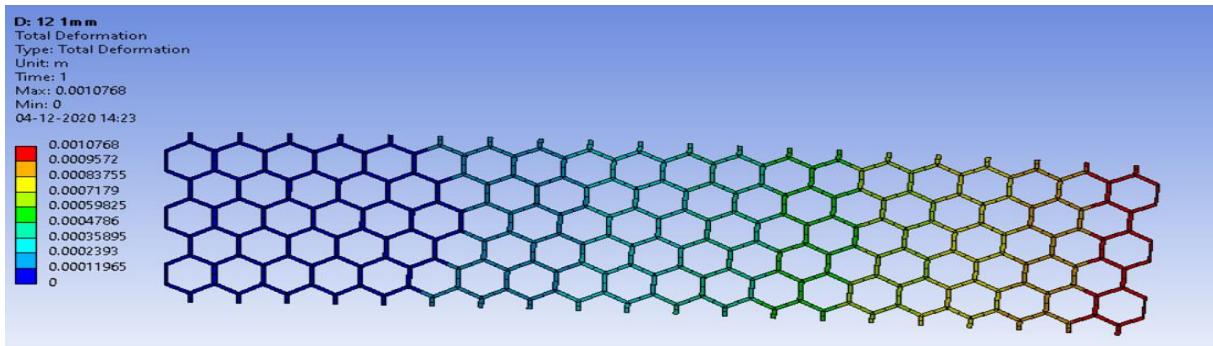

## Deformation of regular Honeycomb Structures

## Chapter 4

### Design of Gradient Honeycomb Structure

- Vertical cell orientation

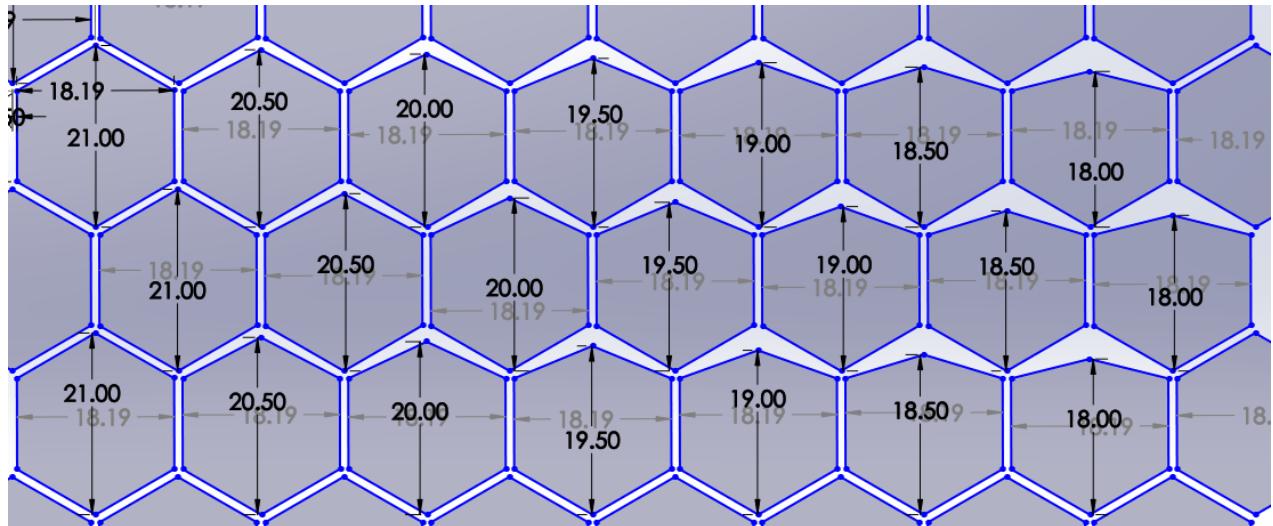

Figure 57 Cell dimensions of Vertical cell oriented Gradient Honeycomb Structure.

- The total length and width of structure are 127.33 mm and 52.5mm respectively. The thickness of whole structure is 30mm.
- Along the length, diagonal length of hexagonal cell is decreased uniformly by 0.5mm by keeping cell size constant i.e., 21mm.

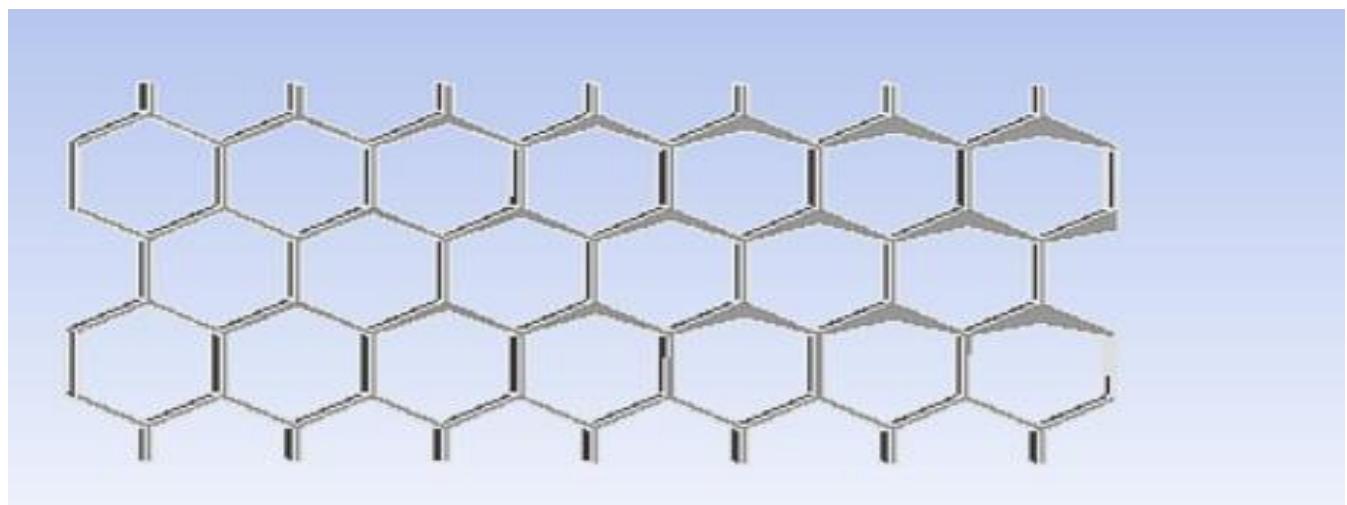

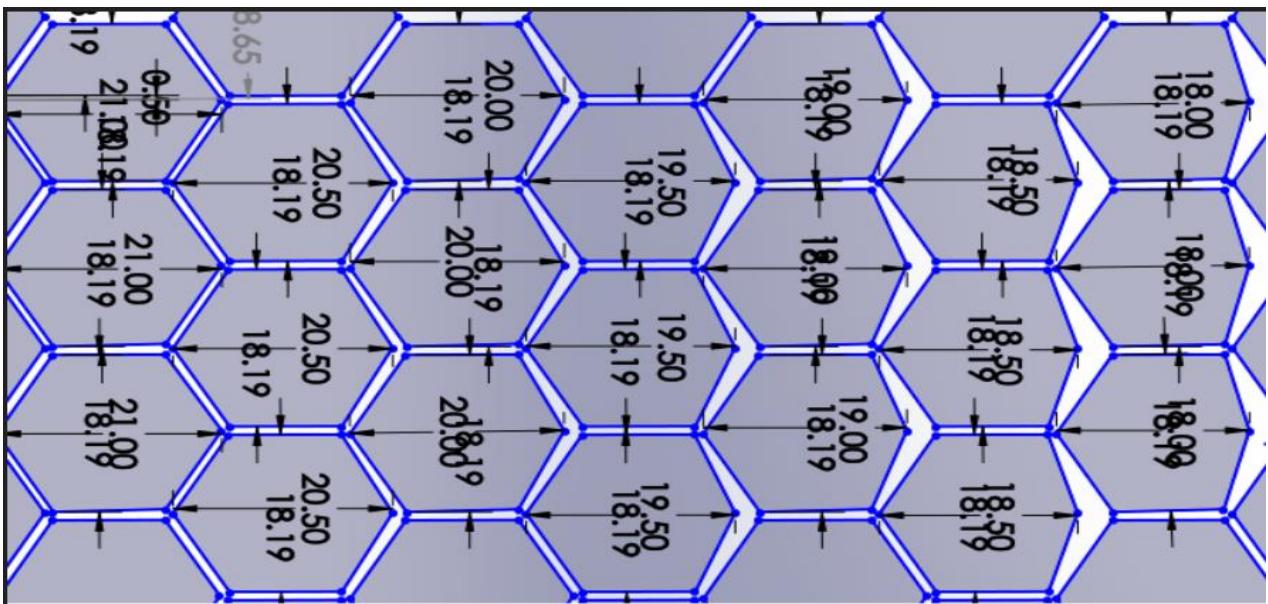

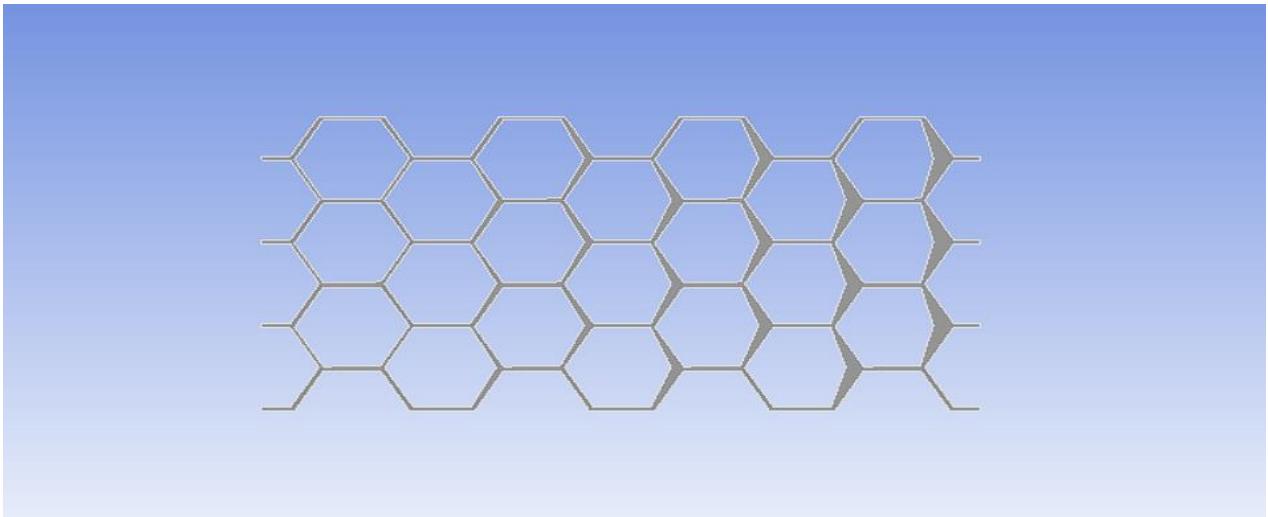

Figure 58 Vertical cell oriented Gradient Honeycomb Structure

- **Horizontal cell orientation**

**Figure 59 Cell dimensions of Horizontal cell oriented Gradient Honeycomb Structure.**

- The total length and width of structure are 107.25 mm and 60.6mm respectively. The thickness of whole structure is 30mm.
- Along the length, diagonal length of hexagonal cell is decreased uniformly by 0.5mm by keeping cell size constant i.e., 21mm.

**Table 3 Types of mode and frequency table for gradient Honeycomb structures**

- Modal analysis is a technique to study the dynamic characteristics of a structure under vibrational excitation. Natural frequencies, mode shapes and mode vectors of a structure can be determined using modal analysis.

- The modal shape represents the way a structure can deflect. Modal shape for lowest frequency indicates the lower energy state.
- Therefore, if you provide very little input to a system it will deflect as mode shape 1. If you continue increasing energy input it will show two, three or next modal shape depending on the energy. The higher modal shapes require very high energy state which a structure or system may not face in its entire life.

## **Boundary Conditions**

- Honeycomb Structure is fixed at one end and 100N force is applied on the other end of structure.
- Total deformation of structure and cell deformation of different cells in different columns were found out in ANSYS.
- Element type- Linear tetrahedral
- All the simulations are performed at ambient temperature (22 °C)
- Sphere material Properties:

## Structural Steel

Fatigue Data at zero mean stress comes from 1998 ASME BPV Code, Section 8, Div 2, Table 5-110.1

Density

7850 kg/m<sup>3</sup>

### Structural

#### ▼ Isotropic Elasticity

Derive from	Young's Modulus and Poisson's Ratio
Young's Modulus	2e+11 Pa
Poisson's Ratio	0.3

- The blue line Indicates total Energy. Maximum total energy is 29.026 J.

## Results and Inferences

- As cell's longest diagonal length decreases along rows i.e., each column will have same cell size, the properties such as Honeycomb density, Cells per honeycomb surface area, foil edge area per honeycomb surface area, exposed foil area per honeycomb volume decrease.

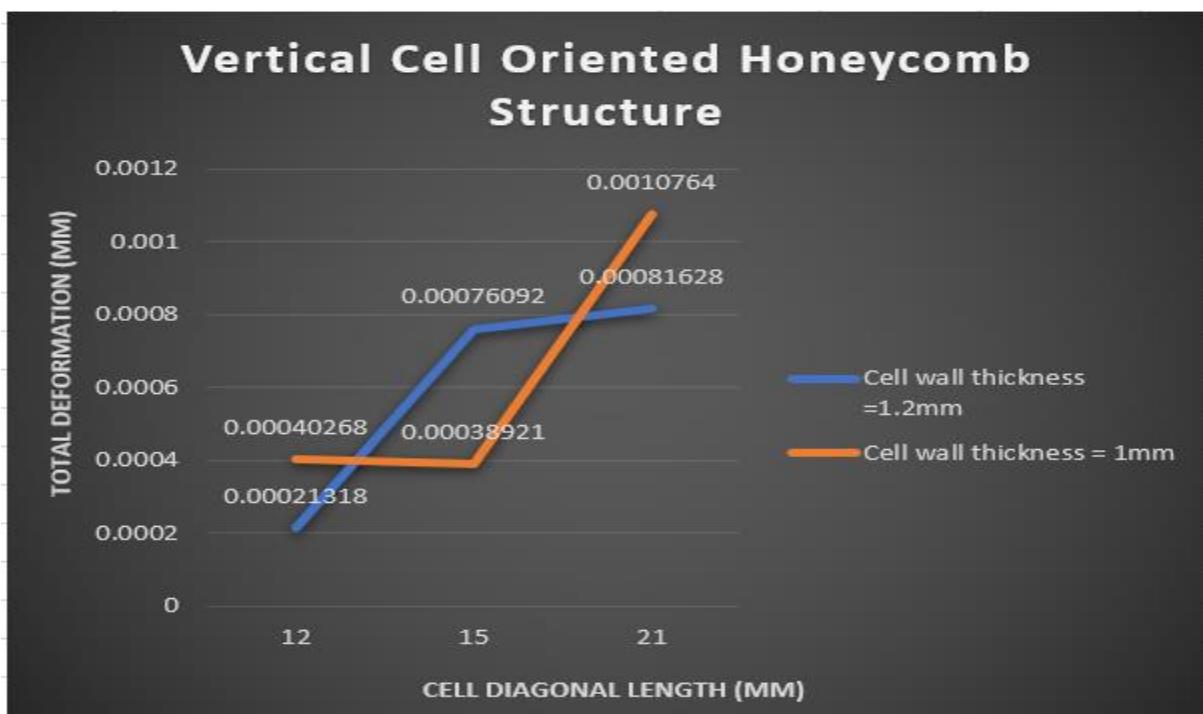

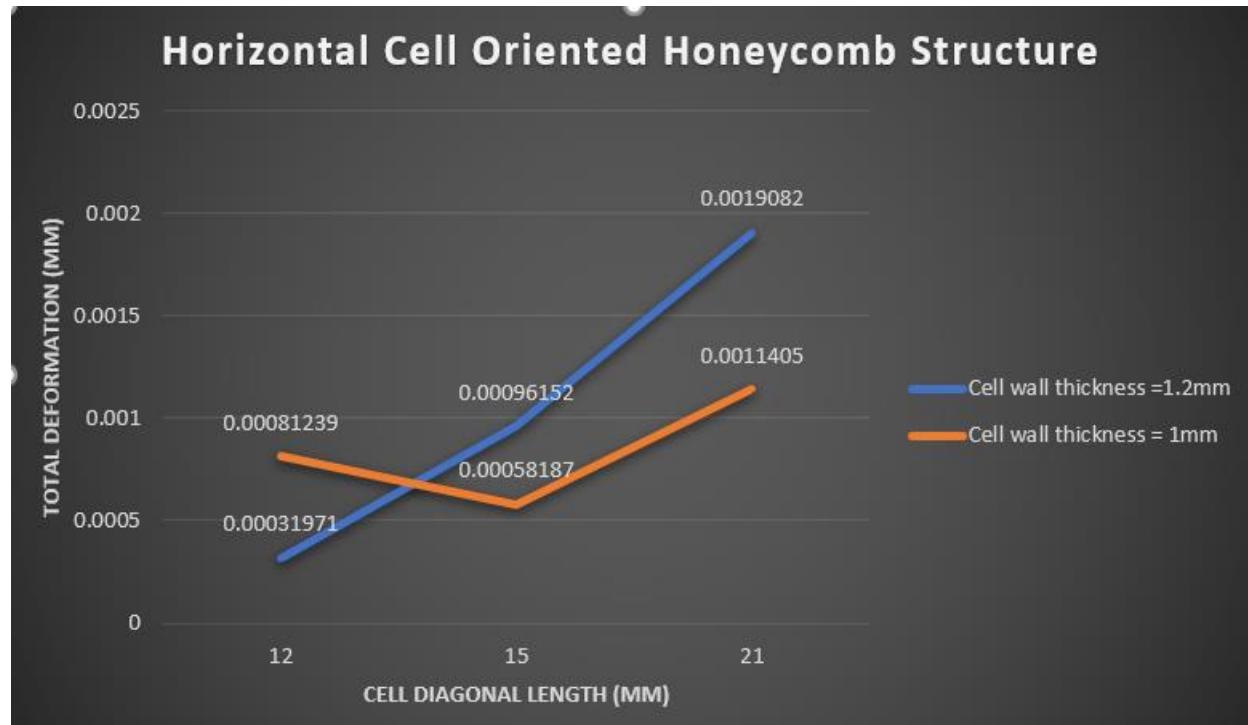

Figure 109 Total Deformation vs Cell diagonal length graph for Vertical Cell Oriented Regular Honeycomb Structure

**Figure 110 Total Deformation vs Cell diagonal length graph for Vertical Cell Oriented Regular Honeycomb Structure**

Observations	Inferences
<ul style="list-style-type: none"> <li>As cell diagonal length increased, total deformation also increased.</li> </ul>	<ul style="list-style-type: none"> <li>For lowest diagonal length in a cell of honeycomb Structure, has high resistance.</li> </ul>
<ul style="list-style-type: none"> <li>As wall thickness increases, total deformation decreased.</li> </ul>	<ul style="list-style-type: none"> <li>Cell wall thickness increases moment of inertia which will decrease deflection.</li> </ul>
<ul style="list-style-type: none"> <li>Except for 15mm,1mm Structure, in which total deformation is lesser than the structure with 15mm and 1.2mm as diagonal length of cell and cell wall thickness respectively.</li> </ul>	<ul style="list-style-type: none"> <li>This is because of total length of structure, as it is to be maintained approximately 220mm length and 50mm width.</li> </ul>

**Table 4 Observation vs Inference table of regular honeycomb structures**

- For almost all the modes, Vertical cell oriented Gradient Honeycomb Structure deforms less than Horizontal cell oriented Gradient Honeycomb Structure.
- But, for all the mode type of Bending +Torsion, Horizontal cell oriented Gradient Honeycomb Structure's maximum deformation is very high.
- The higher modal shapes require very high energy state which a structure or system may not face in its entire life.
- Vertical cell-oriented Honeycomb Structures offer higher bending resistance than Horizontal cell-oriented Honeycomb Structures.
- Gradient Vertical cell-oriented Honeycomb Structures offer higher bending resistance than Gradient Horizontal cell-oriented Honeycomb Structures.
- Maximum deformation occurs at end cell of Honeycomb structure.
- Gradient Honeycomb Structure offers more bending resistance than the regular Honeycomb Structure because of gradual increment in cell wall thickness for a given number of cells.
- Horizontal cell oriented gradient Honeycomb Structure fails at 40 KMPH speed impact load.
- For vertical cell orientated Honeycomb Structure, failure occurs at all the three cases. This is because of resistance offered by Honeycomb cell due to its orientation.
- Horizontal cell-oriented Honeycomb Structure can be used wherever low speed impacts at free end are applied.
- At low speeds Horizontal cell-oriented Honeycomb Structure absorbs more energy than the vertical cell-oriented Honeycomb Structure.

## **Conclusions and Future works**

- Vertical cell-oriented honeycomb structure offers more bending resistance than horizontal cell orientated honeycomb structures.
- Increasing cell diagonal along length increases bending resistance than regular honeycomb structure. (Both for horizontal and vertical cell oriented)
- Compression test on adhesive bonded Honeycomb Sandwiches can also be a future work.
- In future, this can be experimented on cars front exterior as gradient honeycomb structures can sustain impact loading (sudden brakes or speed breaker jerks during drive).

**Figure 111 Honeycomb panels assembled in AUDI R7S**

- Harmonic Analysis and Random Vibration analysis can be done in future to determine the response of the structure under a steady-state sinusoidal (harmonic) loading at a given frequency and to determine structure response at random loading respectively
